Section 1: Coding

#### 1. Problem Statement

John and Mary are collaborating on a project that involves data analysis. They each have a set of age data, one sorted in ascending order and the other in descending order. However, their analysis requires the data to be in ascending order.

Write a program to help them merge the two sets of age data into a single sorted array in ascending order using merge sort.

### **Input Format**

The first line of input consists of an integer N, representing the number of age values in each dataset.

The second line consists of N space-separated integers, representing the ages of participants in John's dataset (in ascending order).

The third line consists of N space-separated integers, representing the ages of participants in Mary's dataset (in descending order).

#### **Output Format**

The output prints a single line containing space-separated integers, which represents the merged dataset of ages sorted in ascending order.

Refer to the sample output for formatting specifications.

    Output: 1 2 3 4 5 6 7 8 9 10
    Answer
    #include <stdio.h>
    // You are using GCC
    void merge(int merged[],int arr1[],int arr2[],int n,int m) {
      int i=0, j=0, k=0;
      while(i < n \&\& j < m){
       if(arr1[i]<=arr2[j]){
          merged[k++]=arr1[i++];
        }else{
          merged[k++]=arr2[j++];
      while(i<n){
        merged[k++]=arr1[i++];
      while(j<m){
        merged[k++]=arr2[j++];
   void mergeSort(int arr[], int n) {
